Slogans

Differential *K*-theory is a "*K*-theory of finite dimensional vector bundles with connections".

It is closely linked to local index theory, as will be described.

▲□▶▲□▶▲□▶▲□▶ □ ● ●

Differential *K*-theory is a "*K*-theory of finite dimensional vector bundles with connections".

It is closely linked to local index theory, as will be described.

Today: Differential *K*-theory as a "*K*-theory of infinite dimensional vector bundles with (super)connections".

Differential *K*-theory is a "*K*-theory of finite dimensional vector bundles with connections".

It is closely linked to local index theory, as will be described.

Today: Differential *K*-theory as a "*K*-theory of infinite dimensional vector bundles with (super)connections".

Some motivation:

- 1. It unifies various earlier models for differential K-theory.
- 2. The analytic index becomes almost tautological.
- 3. The even and odd cases can be treated similarly.
- 4. Extension to twisting by H^3 .

Introduction

Summary of differential K-theory

Superconnections on Hilbert bundles

Infinite dimensional cycles

Twisted differential K-theory

M is a smooth manifold.

 $K^0(M)$ is the free abelian group generated by isomorphism classes of finite dimensional complex vector bundles on M, quotiented by the relations $[E_2] = [E_1] + [E_3]$ if there is a short exact sequence

$$0 \longrightarrow E_1 \longrightarrow E_2 \longrightarrow E_3 \longrightarrow 0.$$

Generators of differential K-theory

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ - 三 - のへぐ

Generators of differential K-theory

Differential *K*-theory combines vector bundles and differential forms. There are various models for the differential *K*-group $\check{K}^0(M)$. Here is a "standard" model.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへで

Differential *K*-theory combines vector bundles and differential forms. There are various models for the differential *K*-group $\check{K}^0(M)$. Here is a "standard" model.

A generator for $\check{K}^0(M)$ is a quadruple $\mathcal{E} = (E, h^E, \nabla^E, \omega)$, where

- *E* is a finite dimensional complex vector bundle on *M*.
- h^E is a Hermitian metric on E.
- ∇^E is a Hermitian connection on *E*.
- $\omega \in \Omega^{odd}(M) / \operatorname{Im}(d)$.

Given three such quadruples, we impose the relation

 $\mathcal{E}_2=\mathcal{E}_1+\mathcal{E}_3$

if there is a short exact sequence of Hermitian vector bundles

$$0 \longrightarrow E_1 \longrightarrow E_2 \longrightarrow E_3 \longrightarrow 0,$$

and

$$\omega_2 = \omega_1 + \omega_3 - \mathcal{CS}\left(
abla^{\mathcal{E}_1},
abla^{\mathcal{E}_2},
abla^{\mathcal{E}_3}
ight) \in \Omega^{\textit{odd}}(M) / \operatorname{Im}(d).$$

Given three such quadruples, we impose the relation

$$\mathcal{E}_2 = \mathcal{E}_1 + \mathcal{E}_3$$

if there is a short exact sequence of Hermitian vector bundles

$$0 \longrightarrow E_1 \longrightarrow E_2 \longrightarrow E_3 \longrightarrow 0,$$

and

$$\omega_2 = \omega_1 + \omega_3 - \mathcal{CS}\left(
abla^{\mathcal{E}_1},
abla^{\mathcal{E}_2},
abla^{\mathcal{E}_3}
ight) \in \Omega^{\textit{odd}}(M) / \operatorname{Im}(d).$$

Here the Chern-Simons form CS satisfies

$$dCS\left(\nabla^{E_{1}},\nabla^{E_{2}},\nabla^{E_{3}}\right) = ch\left(\nabla^{E_{2}}\right) - ch\left(\nabla^{E_{1}}\right) - ch\left(\nabla^{E_{3}}\right)$$

Atiyah-Singer families index theorem

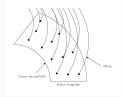

Suppose that $\pi : M \to B$ is a fiber bundle.

Topological assumptions: The fibers are compact and even dimensional. The fiberwise tangent bundle is *spin^c*.

Geometric assumptions: Riemannian metrics on the fibers, Hermitian connection on the associated *spin^c* line bundle.

Introduction

Summary of differential K-theory

Superconnections on Hilbert bundles

Infinite dimensional cycles

Twisted differential K-theory

From the viewpoint of analytic index theory, it is more natural to use infinite dimensional vector bundles.

Unbounded Kasparov KK-theory: $K^0(M) \cong KK^0(\mathbb{C}, C(M))$, the latter being given in terms of unbounded Fredholm operators on \mathbb{Z}_2 -graded Hilbert C(M)-modules. Can we give a model for differential *K*-theory along these lines?

(ロ) (同) (三) (三) (三) (三) (○) (○)

From the viewpoint of analytic index theory, it is more natural to use infinite dimensional vector bundles.

Unbounded Kasparov KK-theory: $K^0(M) \cong KK^0(\mathbb{C}, C(M))$, the latter being given in terms of unbounded Fredholm operators on \mathbb{Z}_2 -graded Hilbert C(M)-modules. Can we give a model for differential *K*-theory along these lines?

If *E* is a finite dimensional \mathbb{Z}_2 -graded vector bundle then

$$\operatorname{ch}(\nabla) = \operatorname{Tr}_{s} e^{-\nabla^{2}}.$$

Problem: This doesn't make sense if *E* is infinite dimensional.

From the viewpoint of analytic index theory, it is more natural to use infinite dimensional vector bundles.

Unbounded Kasparov KK-theory: $K^0(M) \cong KK^0(\mathbb{C}, C(M))$, the latter being given in terms of unbounded Fredholm operators on \mathbb{Z}_2 -graded Hilbert C(M)-modules. Can we give a model for differential *K*-theory along these lines?

If *E* is a finite dimensional \mathbb{Z}_2 -graded vector bundle then

$$\operatorname{ch}(\nabla) = \operatorname{Tr}_{s} e^{-\nabla^{2}}.$$

Problem: This doesn't make sense if *E* is infinite dimensional. Solution: Replace the connection ∇ by a superconnection. *E* is a finite dimensional \mathbb{Z}_2 -graded vector bundle on *M*. (Quillen) A superconnection on *E* is a sum

$${\pmb A} = {\pmb A}_{[0]} + {\pmb A}_{[1]} + {\pmb A}_{[2]} + \dots,$$

where

•
$$A_{[0]} \in \Omega^0(M; \operatorname{End}_{odd}(E))$$

- $A_{[1]}$ is a connection on E
- $A_{[i]} \in \Omega^i(M; \operatorname{End}(E))$ for $i \ge 2$, with odd total parity.

E is a finite dimensional \mathbb{Z}_2 -graded vector bundle on *M*. (Quillen) A superconnection on *E* is a sum

$${\pmb A} = {\pmb A}_{[0]} + {\pmb A}_{[1]} + {\pmb A}_{[2]} + \dots,$$

(日) (日) (日) (日) (日) (日) (日)

where

E is a finite dimensional \mathbb{Z}_2 -graded vector bundle on *M*.

(Quillen) A superconnection on E is a sum

$$A = A_{[0]} + A_{[1]} + A_{[2]} + \dots,$$

where

In the previous description of $\check{K}^0(M)$, you can replace connections by superconnections.

Say that $\mathcal{H} \to M$ is a \mathbb{Z}_2 -graded Hilbert bundle. We want to be able to talk about superconnections on \mathcal{H} .

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ - 三 - のへぐ

Say that $\mathcal{H} \to M$ is a \mathbb{Z}_2 -graded Hilbert bundle. We want to be able to talk about superconnections on \mathcal{H} .

What is the right structure group for the bundle? It should be general enough to include the case of Bismut superconnections, but restrictive enough so that one can still define the Chern character of a superconnection. Say that $\mathcal{H} \to M$ is a \mathbb{Z}_2 -graded Hilbert bundle. We want to be able to talk about superconnections on \mathcal{H} .

What is the right structure group for the bundle? It should be general enough to include the case of Bismut superconnections, but restrictive enough so that one can still define the Chern character of a superconnection.

Say that *H* is a fiber of the bundle. U(H) is too big. We will restrict this using a pseudodifferential calculus based on a "Dirac operator" *D*.

▲□▶▲□▶▲□▶▲□▶ = のへで

Say *H* is a \mathbb{Z}_2 -graded Hilbert space,

$${\it D}=egin{pmatrix} {f 0}&\partial^*_+\\partial_+&{f 0} \end{pmatrix}$$
 is a self-adjoint operator.

Assume that Tr $e^{-\theta D^2} < \infty$ for all $\theta > 0$.

(日) (日) (日) (日) (日) (日) (日)

Clearly $D \in \mathcal{P}$.

Lemma

 \mathcal{P} is closed under order-zero perturbations.

As a set,

$$G = U(H) \cap op^0.$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ - 三 - のへぐ

As a set,

$$G = U(H) \cap op^0.$$

What is the smooth structure? Since we only care about Hilbert bundles over *finite dimensional* manifolds, it's enough to know what a smooth map $\mathbb{R}^k \to G$ is. (Diffeology)

(日) (日) (日) (日) (日) (日) (日)

As a set,

$$G = U(H) \cap op^0.$$

What is the smooth structure? Since we only care about Hilbert bundles over *finite dimensional* manifolds, it's enough to know what a smooth map $\mathbb{R}^k \to G$ is. (Diffeology)

(日) (日) (日) (日) (日) (日) (日)

A map $\mathbb{R}^k \to G$ is declared to be "smooth" if it preserves the smooth maps $\mathbb{R}^k \to H^s$ and $\mathbb{R}^k \to op^k$.

Here H^s and op^k have Fréchet topologies.

Suppose that $\mathcal{H} \to M$ is a \mathbb{Z}_2 -graded Hilbert bundle with structure group *G*. It now makes sense to say that a superconnection on \mathcal{H} is a sum

$$A = A_{[0]} + A_{[1]} + A_{[2]} + \dots,$$

(日) (日) (日) (日) (日) (日) (日)

where

•
$$A_{[0]} \in \Omega^0(M; \mathcal{P})$$

- $A_{[1]} = d + A_{\alpha}$ locally, with $A_{\alpha} \in \Omega^{1}(U_{\alpha}; op^{k_{1}})$
- $A_{[i]} \in \Omega^i(M; op^{k_i})$ for $i \ge 2$, with odd total parity.

Suppose that $\mathcal{H} \to M$ is a \mathbb{Z}_2 -graded Hilbert bundle with structure group *G*. It now makes sense to say that a superconnection on \mathcal{H} is a sum

$$A = A_{[0]} + A_{[1]} + A_{[2]} + \dots,$$

where

•
$$A_{[0]} \in \Omega^0(M; \mathcal{P})$$

• $A_{[1]} = d + A_\alpha$ locally, with $A_\alpha \in \Omega^1(U_\alpha; op^{k_1})$
• $A_{[i]} \in \Omega^i(M; op^{k_i})$ for $i \ge 2$, with odd total parity.
Then

$$\mathsf{ch}(A) = \mathsf{Tr}_{s} \, e^{-A^{2}} \in \Omega^{even}(M)$$

makes sense, using a Duhamel expansion of e^{-A^2} .

If
$$A_{[0]} - A'_{[0]} \in \Omega^0(M; op^0)$$
, put
$$\eta(A, A') = \int_0^1 \operatorname{Tr}_s\left(\frac{dB}{dt}e^{-B^2(t)}\right) dt,$$

where B(t) = (1 - t)A + tA'.

If
$$A_{[0]} - A'_{[0]} \in \Omega^0(M; op^0)$$
, put
 $\eta(A, A') = \int_0^1 \operatorname{Tr}_s\left(\frac{dB}{dt}e^{-B^2(t)}\right) dt$,

where B(t) = (1 - t)A + tA'.

Then

$$d\eta(A,A') = \operatorname{ch}(A) - \operatorname{ch}(A').$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● のへぐ

If
$$A_{[0]} - A'_{[0]} \in \Omega^0(M; op^0)$$
, put

Introduction

Summary of differential *K*-theory

Superconnections on Hilbert bundles

Infinite dimensional cycles

Twisted differential K-theory

Generators are triples $(\mathcal{H}, \mathcal{A}, \omega)$, where

H → *M* is a Z₂-graded Hilbert bundle with structure group *G*.

(日) (日) (日) (日) (日) (日) (日)

- A is a superconnection on \mathcal{H} .
- $\omega \in \Omega^{odd}(M) / \operatorname{Im}(d)$.

Relations for $\check{K}^0(M)$

1.

$[\mathcal{H}, \mathbf{A}, \omega] + [\mathcal{H}', \mathbf{A}', \omega'] = [\mathcal{H} \oplus \mathcal{H}', \mathbf{A} \oplus \mathbf{A}', \omega + \omega']$

1.

$[\mathcal{H}, \mathbf{A}, \omega] + [\mathcal{H}', \mathbf{A}', \omega'] = [\mathcal{H} \oplus \mathcal{H}', \mathbf{A} \oplus \mathbf{A}', \omega + \omega']$

2. If $A_{[0]}$ is fiberwise invertible then

$$[\mathcal{H}, \mathbf{A}, \omega] = [\mathbf{0}, \mathbf{0}, \omega + \eta(\mathbf{A}, \infty)].$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ - 三 - のへぐ

1.

$[\mathcal{H}, \mathcal{A}, \omega] + [\mathcal{H}', \mathcal{A}', \omega'] = [\mathcal{H} \oplus \mathcal{H}', \mathcal{A} \oplus \mathcal{A}', \omega + \omega']$

2. If $A_{[0]}$ is fiberwise invertible then

$$[\mathcal{H}, \mathbf{A}, \omega] = [\mathbf{0}, \mathbf{0}, \omega + \eta(\mathbf{A}, \infty)].$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ - 三 - のへぐ

3. If
$$A_{[0]} - A'_{[0]} \in \Omega^0(M; op^0)$$
 then
 $[\mathcal{H}, A, \omega] = [\mathcal{H}', A', \omega' + \eta(A, A')].$

1.

 $[\mathcal{H}, \mathcal{A}, \omega] + [\mathcal{H}', \mathcal{A}', \omega'] = [\mathcal{H} \oplus \mathcal{H}', \mathcal{A} \oplus \mathcal{A}', \omega + \omega']$

Introduction

Summary of differential *K*-theory

Superconnections on Hilbert bundles

Infinite dimensional cycles

Twisted differential K-theory

There's a notion of *twisted K*-theory, where one twists by an element of $H^3(M; \mathbb{Z})$.

There's a notion of *twisted K*-theory, where one twists by an element of $H^3(M; \mathbb{Z})$.

Using finite dimensional vector bundles, one can only handle *torsion* elements of $H^3(M; \mathbb{Z})$. To deal with all of $H^3(M; \mathbb{Z})$, one needs to use infinite dimensional vector bundles.

There's a notion of *twisted K*-theory, where one twists by an element of $H^3(M; \mathbb{Z})$.

Using finite dimensional vector bundles, one can only handle *torsion* elements of $H^3(M; \mathbb{Z})$. To deal with all of $H^3(M; \mathbb{Z})$, one needs to use infinite dimensional vector bundles.

Can one extend the previous model from differential *K*-theory to twisted differential *K*-theory?

 $H^{3}(M; \mathbb{Z})$ classifies U(1)-gerbes on M. We'll twist by coupling to a gerbe.

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ - 三 - のへぐ

 $H^{3}(M; \mathbb{Z})$ classifies U(1)-gerbes on M. We'll twist by coupling to a gerbe.

Data for a gerbe:

- An open cover $\{U_{\alpha}\}$ of *M*.
- A complex line bundle $\mathcal{L}_{\alpha\beta}$ on $U_{\alpha} \cap U_{\beta}$.
- An isomophism $\mu_{\alpha\beta\gamma} : \mathcal{L}_{\alpha\beta} \otimes \mathcal{L}_{\beta\gamma} \to \mathcal{L}_{\alpha\gamma}$ on $U_{\alpha} \cap U_{\beta} \cap U_{\gamma}$.

We have line bundles $\mathcal{L}_{\alpha\beta}$ on overlaps. A U(1)-connection on the gerbe consists of

- A Hermitian metric on $\mathcal{L}_{\alpha\beta}$.
- Connective structure: A Hermitan connection $abla_{\alpha\beta}$ on $\mathcal{L}_{\alpha\beta}$ so

$$\mu_{\alpha\beta\gamma}^*\nabla_{\alpha\gamma}=(\nabla_{\alpha\beta}\otimes I)+(I\otimes\nabla_{\beta\gamma}).$$

• Curving: $\kappa_{\alpha} \in \Omega^{2}(U_{\alpha})$ so

$$\nabla_{\alpha\beta}^2 = \kappa_\alpha - \kappa_\beta.$$

We have line bundles $\mathcal{L}_{\alpha\beta}$ on overlaps. A U(1)-connection on the gerbe consists of

- A Hermitian metric on $\mathcal{L}_{\alpha\beta}$.
- Connective structure: A Hermitan connection $abla_{\alpha\beta}$ on $\mathcal{L}_{\alpha\beta}$ so

$$\mu_{\alpha\beta\gamma}^*\nabla_{\alpha\gamma} = (\nabla_{\alpha\beta}\otimes I) + (I\otimes\nabla_{\beta\gamma}).$$

• Curving: $\kappa_{\alpha} \in \Omega^{2}(U_{\alpha})$ so

$$\nabla_{\alpha\beta}^2 = \kappa_\alpha - \kappa_\beta.$$

Then $H = d\kappa_{\alpha}$ is a globally defined closed 3-form on M, the de Rham representative of the gerbe's class in $H^3(M; \mathbb{Z})$.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

A superconnection on \mathcal{H} is given by superconnections A_{α} on the \mathcal{H}_{α} 's so $\phi_{\alpha\beta}^* A_{\beta} = (A_{\alpha} \otimes I) + (I \otimes \nabla_{\alpha\beta})$ on $U_{\alpha} \cap U_{\beta}$.

A superconnection on \mathcal{H} is given by superconnections A_{α} on the \mathcal{H}_{α} 's so $\phi_{\alpha\beta}^* A_{\beta} = (A_{\alpha} \otimes I) + (I \otimes \nabla_{\alpha\beta})$ on $U_{\alpha} \cap U_{\beta}$.

Put

$$\operatorname{ch}(A) = \operatorname{Tr}_{s} e^{-(A_{\alpha}^{2} + \kappa_{\alpha})} \in \Omega^{even}(M).$$

Then

$$(d + H \wedge) \operatorname{ch}(A) = 0.$$

◆□▶ ◆□▶ ▲□▶ ▲□▶ ■ ののの

A superconnection on \mathcal{H} is given by superconnections A_{α} on the \mathcal{H}_{α} 's so $\phi_{\alpha\beta}^* A_{\beta} = (A_{\alpha} \otimes I) + (I \otimes \nabla_{\alpha\beta})$ on $U_{\alpha} \cap U_{\beta}$.

Put

$$\operatorname{ch}(A) = \operatorname{Tr}_{s} e^{-(A_{\alpha}^{2} + \kappa_{\alpha})} \in \Omega^{even}(M).$$

Then

$$(d + H \wedge) \operatorname{ch}(A) = 0.$$

The generators for twisted differential *K*-theory are now triples (\mathcal{H}, A, ω) as before. Quotienting by the relations, one gets the twisted differential *K*-theory group.

Theorem (Gorokhovsky-L.): Up to isomorphism, the twisted differential K-group only depends on the gerbe through its isomorphism class. It is independent of the choices of connective structure and curving.

< □ > < 同 > < 三 > < 三 > < 三 > < ○ < ○ </p>

Theorem (Gorokhovsky-L.): Up to isomorphism, the twisted differential K-group only depends on the gerbe through its isomorphism class. It is independent of the choices of connective structure and curving.

This gives an explicit model for twisted differential *K*-theory. It remains to show that it agrees with other models (Bunke-Nikolaus).
