3 Annuities-due

- An annuity is a series of payments made
- \* at specified intervals (e.g., yearly whence the name) called the payment periods
- \* for a certain (defined in advance) length of time
- If the length of time is fixed (deterministic), then the annuity is called annuity certain
- If not, then it is called a contingent annuity; an important example is the life annuity
- If the length of time is deterministic and infinite, the annuity is called a perpetuity

If Roger is to deplete the \$1000 that are presently on his account in exactly 10 years - this precisely means that the present value of the annuity immediate equals \$1000.So, if we denote the level amounts of each withdrawal by R, we have the following equation

$$R \cdot a_{\overline{40}|0.02} = 1000$$

- Assume that a \$1000 loan is to be repaid over a 10-year period by level payments at the end of each year. Let the effective rate of interest be 9% per annum. What is the total amount of interest repaid?
- ⇒ Let R denote the level payment amount. Then the equation of value at the inception of the loan reads as

$$R \cdot a_{\overline{10}} = 1000$$

Hence, R = 155.82

The total amount of interest paid is equal to

$$10 \cdot R - 1000 = 1558.2 - 1000 = 558.2$$

- Assume that a \$1000 loan is to be repaid over a 10-year period by level payments at the end of each year. Let the effective rate of interest be 9% per annum. What is the total amount of interest repaid?
- $\Rightarrow$  Let R denote the level payment amount. Then the equation of value at the inception of the loan reads as

$$R \cdot a_{\overline{10}} = 1000$$

Hence, R = 155.82

The total amount of interest paid is equal to

$$10 \cdot R - 1000 = 1558.2 - 1000 = 558.2$$

- Assume that a \$1000 loan is to be repaid over a 10-year period by level payments at the end of each year. Let the effective rate of interest be 9% per annum. What is the total amount of interest repaid?
- $\Rightarrow$  Let R denote the level payment amount. Then the equation of value at the inception of the loan reads as

$$R \cdot a_{\overline{10}} = 1000$$

Hence, R = 155.82

The total amount of interest paid is equal to

$$10 \cdot R - 1000 = 1558.2 - 1000 = 558.2$$

- Assume that a \$1000 loan is to be repaid over a 10-year period by level payments at the end of each year. Let the effective rate of interest be 9% per annum. What is the total amount of interest repaid?
- $\Rightarrow$  Let R denote the level payment amount. Then the equation of value at the inception of the loan reads as

$$R \cdot a_{\overline{10}} = 1000$$

Hence, R = 155.82

The total amount of interest paid is equal to

$$10 \cdot R - 1000 = 1558.2 - 1000 = 558.2$$

- Assume that a \$1000 loan is to be repaid over a 10-year period by level payments at the end of each year. Let the effective rate of interest be 9% per annum. What is the total amount of interest repaid?
- $\Rightarrow$  Let R denote the level payment amount. Then the equation of value at the inception of the loan reads as

$$R \cdot a_{\overline{10}} = 1000$$

Hence, R = 155.82

The total amount of interest paid is equal to

$$10 \cdot R - 1000 = 1558.2 - 1000 = 558.2$$

## An Example: An implementation of Algorithm 3.2.14

 A fund of \$25,000 is to be accumulated by means of deposits of \$1,000 made at the end of every year as long as necessary. Assume that the fund earns an effective interest rate of 8% per annum. Find the number of regular (level) deposits that will be necessary, and the size of the final deposit.

 $\Rightarrow$  The final time *n* equation of value is

$$1000 \cdot s_{\overline{n}} = 25000$$

So,

$$s_{\overline{n}|} = \frac{(1+i)^n - 1}{i} = \frac{(1.08)^n - 1}{0.08} = 25$$

Using your calculator, you get that n = 15

After the end of the 14<sup>th</sup> year, i.e., after the first 14 payments were made, the balance in the fund is

$$1000s_{\overline{14}|} = 24,215$$

With interest only, the amount in the fund grows to be

$$24,215 \cdot 1.08 = 26,152$$

 $\Rightarrow$  The final time *n* equation of value is

$$1000 \cdot s_{\overline{n}} = 25000$$

So.

$$s_{\overline{n}|} = \frac{(1+i)^n - 1}{i} = \frac{(1.08)^n - 1}{0.08} = 25$$

Using your calculator, you get that n = 15

After the end of the 14<sup>th</sup> year, i.e., after the first 14 payments were made, the balance in the fund is

$$1000s_{\overline{14}} = 24,215$$

With interest only, the amount in the fund grows to be

$$24,215 \cdot 1.08 = 26,152$$

 $\Rightarrow$  The final time *n* equation of value is

$$1000 \cdot s_{\overline{n}} = 25000$$

So,

$$s_{\overline{n}|} = \frac{(1+i)^n - 1}{i} = \frac{(1.08)^n - 1}{0.08} = 25$$

Using your calculator, you get that n = 15

After the end of the  $14^{th}$  year, i.e., after the first 14 payments were made, the balance in the fund is

$$1000s_{\overline{14}} = 24,215$$

With interest only, the amount in the fund grows to be

$$24,215 \cdot 1.08 = 26,152$$

 $\Rightarrow$  The final time *n* equation of value is

$$1000 \cdot s_{\overline{n}} = 25000$$

So,

$$s_{\overline{n}|} = \frac{(1+i)^n - 1}{i} = \frac{(1.08)^n - 1}{0.08} = 25$$

Using your calculator, you get that n = 15

After the end of the 14<sup>th</sup> year, i.e., after the first 14 payments were made, the balance in the fund is

$$1000s_{\overline{14}|} = 24,215$$

With interest only, the amount in the fund grows to be

$$24,215 \cdot 1.08 = 26,152$$

 $\Rightarrow$  The final time *n* equation of value is

$$1000 \cdot s_{\overline{n}} = 25000$$

So,

$$s_{\overline{n}|} = \frac{(1+i)^n - 1}{i} = \frac{(1.08)^n - 1}{0.08} = 25$$

Using your calculator, you get that n = 15

After the end of the  $14^{th}$  year, i.e., after the first 14 payments were made, the balance in the fund is

$$1000s_{\overline{14}} = 24,215$$

With interest only, the amount in the fund grows to be

$$24,215 \cdot 1.08 = 26,152$$

# A useful equality

$$i + \frac{1}{s_{\overline{n}|i}} = i + \frac{i}{(1+i)^n - 1}$$

$$= i \cdot \left[ 1 + \frac{1}{(1+i)^n - 1} \right]$$

$$= i \cdot \frac{(1+i)^n}{(1+i)^n - 1}$$

$$= i \cdot \frac{1}{1 - v^n} = \frac{1}{a_{\overline{n}|i}}$$

Question: Can we interpret this formula

## A useful equality

$$i + \frac{1}{s_{\overline{n}|i}} = i + \frac{i}{(1+i)^n - 1}$$

$$= i \cdot \left[ 1 + \frac{1}{(1+i)^n - 1} \right]$$

$$= i \cdot \frac{(1+i)^n}{(1+i)^n - 1}$$

$$= i \cdot \frac{1}{1 - v^n} = \frac{1}{a_{\overline{n}|i}}$$

Question: Can we interpret this formula?

- Let us consider the loan repayment problem once more; as we have seen, we can set up a repayment schedule as a level annuity-immediate
- This time we propose a different scheme to repay the loan
- A \$1000 loan is to be repaid over a 10-year period in the following way:
- \* at the end of each year the interest accrued is repaid
- \* the entire principal is repaid at the end of 10 years.

- Let us consider the loan repayment problem once more; as we have seen, we can set up a repayment schedule as a level annuity-immediate
- This time we propose a different scheme to repay the loan
- A \$1000 loan is to be repaid over a 10-year period in the following way:

- Again, if we assume that the rate of interest is constant and equal to i in each payment period
- Writing the time 0 equation of value (with the help of a time-line), we get

$$\ddot{a}_{\overline{n}|i} = \frac{1 - v^n}{d}$$

- If an annuity is such that the payments are made at the beginning of the payment periods, then it is called an annuity-due
- If the amount paid at the end of each period is equal to \$1, we call this annuity the basic annuity-due
- ä<sub>n</sub> ... denotes the **present value** of all the payments made by a basic annuity-due over the length of time equal to n periods
- Again, if we assume that the rate of interest is constant and equal to i in each payment period
- Writing the time 0 equation of value (with the help of a time-line), we get

$$\ddot{a}_{\overline{n}|i} = \frac{1 - v^n}{d}$$

#### Notation: Accumulated value

\$\vec{s}\_{n\vec{n}}\$ ... denotes the accumulated value at time n of all the payments made by a basic annuity-due over the length of time equal to n periods, i.e.,

$$\ddot{s}_{\overline{n}} = a(n)\ddot{a}_{\overline{n}}$$

or, equivalently,

$$\ddot{a}_{\overline{n}|} = v(n)\ddot{s}_{\overline{n}|}$$

 Again, in the particular case of compound interest with the fixed interest rate of i per period, we write

$$\ddot{\mathbf{s}}_{\overline{n}|i} = (1+i)^n \cdot \ddot{\mathbf{a}}_{\overline{n}|i} = \frac{(1+i)^n - 1}{d}$$

or, equivalently,

$$\ddot{a}_{\overline{n}|i} = v^n \cdot \ddot{s}_{\overline{n}|i}$$

#### Notation: Accumulated value

\$\vec{s}\_{n\vec{n}}\$ ... denotes the accumulated value at time n of all the payments made by a basic annuity-due over the length of time equal to n periods, i.e.,

$$\ddot{s}_{\overline{n}} = a(n)\ddot{a}_{\overline{n}}$$

or, equivalently,

$$\ddot{a}_{\overline{n}|} = v(n)\ddot{s}_{\overline{n}|}$$

 Again, in the particular case of compound interest with the fixed interest rate of i per period, we write

$$\ddot{s}_{\overline{n}|i} = (1+i)^n \cdot \ddot{a}_{\overline{n}|i} = \frac{(1+i)^n - 1}{d}$$

or, equivalently,

$$\ddot{a}_{\overline{n}|i} = v^n \cdot \ddot{s}_{\overline{n}|i}$$

# Connection between annuity-immediate and annuity-due

• The most basic relationship is obtained through discounting:

$$\ddot{a}_{\overline{n}|i} = (1+i)a_{\overline{n}|i}$$

and, equivalently,

$$\ddot{s}_{\overline{n}|i} = (1+i)s_{\overline{n}|i}$$

• The other basic relationship is obtained by "shifting the time" by one

$$\ddot{a}_{\overline{n}|} = 1 + a_{\overline{n-1}}$$

and

$$\ddot{s}_{\overline{n}} + 1 = s_{\overline{n+1}}$$

# Connection between annuity-immediate and annuity-due

The most basic relationship is obtained through discounting:

$$\ddot{a}_{\overline{n}|i} = (1+i)a_{\overline{n}|i}$$

and, equivalently,

$$\ddot{s}_{\overline{n}|i} = (1+i)s_{\overline{n}|i}$$

• The other basic relationship is obtained by "shifting the time" by one

$$\ddot{a}_{\overline{n}|} = 1 + a_{\overline{n-1}|}$$

and

$$\ddot{s}_{\overline{n}|} + 1 = s_{\overline{n+1}|}$$

- Roger wants to accumulate (at least) \$1000 in a fund at the end of 12 years. To accomplish this he plans to make deposits at the end of each year, the final payment being made one year prior to the end of the investment period. How large (at least) should each deposit be if the fund earns 7% effective per annum?
- ⇒ We are interested in the accumulated value of the investments one year after the last payment, so the equation of value should involve an annuity-due.

Denote the unknown level annual payment by R. Then, we can formalize the conditions in the example as

$$R \cdot \ddot{s}_{\overline{11}} = 1000$$

. . . and so

$$R = \frac{1000}{1.07 \cdot 15.7836} = 59.21$$
