**Problem 4.2.** Assume the Black-Scholes framework. You are given the following information for a stock that pays dividends continuously at a rate proportional to its price:

- (i) The current stock price is \$250. \$(0)
- (ii) The stock's volatility is 0.3. ≥ ♥
- (iii) The continuously compounded expected rate of stock-price appreciation is 15%.

Find the value  $s^*$  such that

$$\mathbb{P}[S(4) > s^*] = 0.05.$$

S(T) = S(0) e (a-8-52). T+ O(T)

- (a) \$861.65
- (b) \$874.18
- (c) \$889.94
- (d) \$905.48
- (e) None of the above.

W/ ZNN10,1)

We know that the percentiles of the std normal Z correspond to the percentiles of the stock price SCT).

So, we find the critical value z\* s.t. P[ Z >z\*] = 0.05

Then,

S#= S(0) e(d-8-02). T+017. Z# w/ be the constant we seek

Our x\* = 1.645 =>  $5^* = 250e^{(0.45 - \frac{0.09}{2}) \cdot 4 + 0.3\sqrt{4} \cdot (4.645)}$ => | s\* = 1020.92

Review:

$$P[S(T) > K] = N(\hat{d}_2)$$

$$\omega = \frac{1}{\sigma T} \left[ ln(\frac{S(0)}{K}) + (\omega - S - \frac{\sigma^2}{2}) \cdot T \right]$$

Note: Under the visk-neutral measure  $\mathbb{P}^*$ ,  $\mathbb{P}^*[S(T)>K]=N(d_2)$ 

$$\omega / d_2 = \frac{1}{\sigma \sqrt{T}} \left[ ln \left( \frac{S(0)}{K} \right) + \left( r - 8 - \frac{\sigma^2}{2} \right) \cdot T \right]$$

Q: What is the probab. that a European K: strike put is in the money on its exercise date T?

= 1-N( $\hat{a}_{2}$ ) = N(- $\hat{a}_{2}$ ) P[S(T) < K] = N(- $\hat{a}_{2}$ ) Problem. Let the current stock price be \$100. The stock price @ any later date is modeled as lognormal. According to your model: ( · P[S(1/4) < 95] = 0.2358 [ P[S(1/2) < 110] = 0.6026 What is the expected value of the time. I stock price? The any T, we have  $S(T) = S(0) e^{(\alpha - \delta - \frac{\alpha^2}{2}) \cdot T} + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2}) \cdot T + O(T \cdot Z)$   $= (\omega - \delta - \frac{\alpha^2}{2})$ => E[S(1)] = S(0) e H+ 92 · Focus on P[S(1/4) < 95] = 0.2358 The complementary probab: 1-0.2358 = 0.7642 => X\* = - 0.72 => 95 = 100e \(\frac{14}{4}\) + \(\sigma\frac{14}{4}\) \(\cdot\) (-0.72)  $= > \frac{1}{4} \mu + \frac{1}{2} \sigma (-0.72) = ln (0.95)$  (I)

Focus on 
$$P[S(\frac{1}{2}) < 110] = 0.6026$$
 $Z_{0.6026}^{*} = 0.26$ 
 $\Rightarrow 110 = 100 \cdot e^{\mu(\frac{1}{2})} + \sigma\sqrt{\frac{1}{2}} (0.26)$ 
 $\Rightarrow \frac{1}{2} \mu + \sigma\sqrt{\frac{1}{2}} (0.26) = \ln(1.1)$ 

(I)

Combine (I) & (II).

Get:  $\sigma = 0.2189$ ;  $\mu = 0.1101$ 

Finally,  $\mathbb{E}[S(1)] = 100 e^{0.1101} + \frac{(0.2189)^2}{2}$ 

Log Normal "confidence" intervals. By design: two sided · symmetric Given a probability, i.e., a "confidence" level CE(0,1) Then, Su= S(0) e (0-8-52).T+017.2\* SL= S(0) e (0-8-52).T+017 (-2\*)

## **★ 50.** Assume the Black-Scholes framework.

You are given the following information for a stock that pays dividends continuously at a rate proportional to its price.

- (i) The current stock price is 0.25. = S(o)
- (ii) The stock's volatility is 0.35.
- (iii) The continuously compounded expected rate of stock-price appreciation is 15%.

Calculate the upper limit of the 90% lognormal confidence interval for the price of the stock in 6 months.

T=
$$\frac{1}{2}$$

$$7* = N^{-1}(0.95) = 1.645$$
(A) 0.393
$$\Rightarrow S_0 = 0.25e^{(0.45 - \frac{(0.35)^2}{2}) \cdot \frac{1}{2} + 0.35\sqrt{\frac{1}{2}} \cdot \frac{(1.645)^2}{2}}$$

- (B) 0.425
- (C) 0.451 =>  $S_0 = 0.393$  => (A)
- (D) 0.486
- (E) 0.529

## **51-53. DELETED**

**54.** Assume the Black-Scholes framework. Consider two nondividend-paying stocks whose time-t prices are denoted by  $S_1(t)$  and  $S_2(t)$ , respectively.

You are given:

- (i)  $S_1(0) = 10$  and  $S_2(0) = 20$ .
- (ii) Stock 1's volatility is 0.18.
- (iii) Stock 2's volatility is 0.25.
- (iv) The correlation between the continuously compounded returns of the two stocks is -0.40.
- (v) The continuously compounded risk-free interest rate is 5%.
- (vi) A one-year European option with payoff max{min[ $2S_1(1), S_2(1)$ ] 17, 0} has a current (time-0) price of 1.632.

Consider a European option that gives its holder the right to sell either two shares of Stock 1 or one share of Stock 2 at a price of 17 one year from now.

Calculate the current (time-0) price of this option.
