

## CONDITIONAL AND MARGINAL MEANS AND VARIANCES

**Marginal Variance:** The *definition* of the (population) (marginal) variance of a random variable  $Y$  is

$$\text{Var}(Y) = E([Y - E(Y)]^2)$$

What does this say in words (and pictures)?

There is another *formula* for  $\text{Var}(Y)$  that is sometimes useful in computing variances or proving things about them. It can be obtained by multiplying out the squared expression in the definition:

$$\text{Var}(Y) = E([Y - E(Y)]^2) = E(Y^2 - 2YE(Y) + [E(Y)]^2)$$

$$= \underline{\hspace{15cm}}$$

(Fill in details, and say the final result in words!)

**Conditional Variance:** Similarly, if we are considering a conditional distribution  $Y|X$ , we define the *conditional variance*

$$\text{Var}(Y|X) = \text{Variance of the conditional distribution } Y|X$$

$$= E([Y - E(Y|X)]^2 | X)$$

(Note that *both* expected values here are conditional expected values.)

What does this say in words (and pictures)?

Exercise: Derive another formula for the conditional variance, analogous to the second formula for the marginal variance. (And say it in words!)

**Conditional Variance as a Random Variable:** As with  $E(Y|X)$ , we can consider  $\text{Var}(Y|X)$  as a random variable. For example, if  $Y = \text{height}$  and  $X = \text{sex}$  for persons in a certain population, then  $\text{Var}(\text{height} | \text{sex})$  is the variable which assigns to each person in the population the variance of height for that person's sex.

**Expected Value of the Conditional Variance:** Since  $\text{Var}(Y|X)$  is a random variable, we can talk about its expected value. Using the formula  $\text{Var}(Y|X) = E(Y^2|X) - [E(Y|X)]^2$ , we have

$$E(\text{Var}(Y|X)) = E(E(Y^2|X)) - E([E(Y|X)]^2)$$

We have already seen that the expected value of the conditional expectation of a random variable is the expected value of the original random variable, so applying this to  $Y^2$  gives

$$(*) \quad E(\text{Var}(Y|X)) = E(Y^2) - E([E(Y|X)]^2)$$

**Variance of the Conditional Expected Value:** For what comes next, we will need to consider the variance of the conditional expected value. Using the second formula for variance, we have

$$\text{Var}(E(Y|X)) = E([E(Y|X)]^2) - [E(E(Y|X))]^2$$

Since  $E(E(Y|X)) = E(Y)$ , this gives

$$(**) \text{Var}(E(Y|X)) = E([E(Y|X)]^2) - [E(Y)]^2.$$

**Putting It Together:**

Note that (\*) and (\*\*) both contain the term  $E([E(Y|X)]^2)$ , but with opposite signs. So adding them gives:

$$E(\text{Var}(Y|X)) + \text{Var}(E(Y|X)) = E(Y^2) - [E(Y)]^2,$$

which is just  $\text{Var}(Y)$ . In other words,

$$(***) \quad \text{Var}(Y) = E(\text{Var}(Y|X)) + \text{Var}(E(Y|X)).$$

In words: The marginal variance is the sum of the expected value of the conditional variance and the variance of the conditional means.

**Consequences:**

I) This says that two things contribute to the marginal (overall) variance: the expected value of the conditional variance, and the variance of the conditional means. (See Exercise) Moreover,  $\text{Var}(Y) = E(\text{Var}(Y|X))$  if and only if  $\text{Var}(E(Y|X)) = 0$ . What would this say about  $E(Y|X)$ ?

II) Since variances are always non-negative, (\*\*\*) implies

$$\text{Var}(Y) \geq E(\text{Var}(Y|X)).$$

III) Since  $\text{Var}(Y|X) \geq 0$ ,  $E(\text{Var}(Y|X))$  must also be  $\geq 0$ . (Why?). Thus (\*\*\*) implies

$$\text{Var}(Y) \geq \text{Var}(E(Y|X)).$$

Moreover,  $\text{Var}(Y) = \text{Var}(E(Y|X))$  if and only if  $E(\text{Var}(Y|X)) = 0$ . What would this imply about  $\text{Var}(Y|X)$  and about the relationship between  $Y$  and  $X$ ?

IV) Another perspective on (\*\*\*) (cf. Textbook, pp. 36 - 37):

Note that:

- i)  $E(\text{Var}(Y|X))$  is a weighted average of  $\text{Var}(Y|X)$
- ii)  $\text{Var}(E(Y|X)) = E([E(Y|X) - E(E(Y|X))]^2)$   
 $= E([E(Y|X) - (E(Y))]^2)$ ,  
 which is a weighted average of  $[E(Y|X) - (E(Y))]^2$

Thus, (\*\*\*) says that  $\text{Var}(Y)$  is a weighted mean of  $\text{Var}(Y|X)$  plus a weighted mean of  $[E(Y|X) - (E(Y))]^2$  (and is a weighted mean of  $\text{Var}(Y|X)$  if and only if all conditional expected values  $E(Y|X)$  are equal to the marginal expected value  $E(Y)$ .)

EXERCISE: What contributes most to  $\text{Var}(Y)$ :  $\text{Var}(E(Y|X))$  or  $E(\text{Var}(Y|X))$ ?

A.

B.

C.
